

EXP NO: 06 Workflow Automation in Zoho Creator — Insurance Claim System

Name: Athithya R Roll No: _____

1. Aim

To automate the approval and notification process of the "Insurance Claim" application in Zoho Creator, so that every insurance claim submitted by a claimant is automatically routed to an approver for review, and the outcome of the review (approved or rejected) triggers an email notification — without any manual follow-up from the insurance staff.

2. Procedure

2.1 Creating the Application, Form and Approval Workflow

1. Create a new application in Zoho Creator for handling insurance claims (named **vidyut** here). The application dashboard, with its Design, Workflow and Settings tabs, is the starting point for building the forms, reports and workflows.

Explanation: This is the Design view of the application. The left menu lists the pages of the app — the *Basements* group (basement, All Basements, business report) and the Startup page. The "business report" page shows the claims as a Kanban board with Open, In Progress and Completed columns; each card displays the Claimant_Name, Residential_Address, Email_Address, Contact_Number and Policy_Number of a claim.

2. Create the claim form (named **basement**) with the fields Claimant_Name, Email_Address, Residential_Address, Contact_Number, Policy_Number, Incident_Description, Claim_Amount_Requested, Date_Of_Incident and Preferred_Callback_Time, followed by the claim-type field. Email_Address and Contact_Number are marked mandatory.

The screenshot shows the 'basement' claim form in the Zia application. The form is filled with sample data:

- Claimant_Name: ATHITHYA R
- Email_Address: athithya.r.2024.cbs@rajalakshmi.edu.in
- Residential_Address: madurai
- Contact_Number: +91 81234 56789
- Policy_Number: 4525365356
- Incident_Description: accident
- Claim_Amount_Requested: 646766
- Date_Of_Incident: 29-Oct-2026
- Preferred_Callback_Time: 10:50:43

Explanation: The screenshot shows the claim form opened in the live application with a sample claim filled in: claimant name, e-mail address, residential address (address lines, city, state, postal code, country), contact number, policy number (4525365356), incident description ("accident"), claim amount requested (646766), date of incident (29-Oct-2026) and the preferred callback time. Every submission of this form becomes a claim record that enters the approval chain.

3. Open the **Workflow** tab, go to the **Approvals** section and click **New Workflow**. Choose the form "basement", name the workflow **Insurance Claim Approval** and set it to run on every new record so that each claim automatically enters the approval chain. Then add the Level 1 approver.

The screenshot shows the Zia Workflow tab, Approvals section. It displays a table with the following workflow:

Workflow Name	Details	When	Status	Created On
Insurance Claim Approval	2 Actions	On review	Enabled	06-Oct-2026

Explanation: The Approvals tab under Workflow now lists the "Insurance Claim Approval" workflow against the *basement* form. It runs *On review*, has 2 actions attached, is marked **Enabled** and was created on 06-Oct-2026.

2.2 Configuring the Approver and the Approve / Reject Actions

4. Open the Insurance Claim Approval workflow. The Approval Events panel on the right lists the events that can carry actions: **On Start** and **Level 1 Approver**, which branches into **Approve** and **Reject**. The Level 1 approver is set to the **CEO**.

5. Under the **Approve** branch, an action "Send email to \${approver.submitter}" is added with the condition *Execute without condition*, so the submitter is e-mailed as soon as the claim is approved.

6. Under the **Reject** branch, the same "Send email to \${approver.submitter}" action is added, so the submitter is e-mailed as soon as the claim is rejected.

Explanation: The approval builder shows the Level 1 approver (CEO) and both decision branches. Each branch contains one email action addressed to the submitter, and an "Add New Action" slot below it lets further actions be attached. Tying the actions to the approver's decision means the notification is sent only after the claim has been reviewed, not on every save.

3. Output

Once the approval workflow was enabled, every claim submitted through the form began flowing through the automated approval chain, and an email notification is sent to the claimant to acknowledge the claim and report its status.

Email Notification Output

Explanation: The claimant receives the "Insurance Claim Received" email in the Gmail inbox. It confirms that the claim is registered and under review, and lists the claim details — claim reference number (IC-2025-004321), policy number (PLI-4587-6621), claim type (Health Insurance), claim date (10-Sep-2025), amount claimed (Rs. 1,25,000) and status (Under Review) — and states that the claims team will respond within 3–5 business days.

4. Result

An approval-driven workflow was successfully built for the Insurance Claim application in Zoho Creator. Every new claim is automatically queued for Level 1 review, and the actions attached to the Approve and Reject branches automatically send email notifications to the submitter. This removes manual follow-up, ensures every claim is reviewed in a consistent and traceable manner, and keeps the claimant informed about the status of the claim.
